Python

Contents

1	Chosen Language	2
2	Reflection and meta-programming	4
2.1	Reflective features	4
2.2	Applications of reflection	4
2.3	Comparison with other languages	4
3	Conclusion	6

1 Chosen Language

- What language have you chosen (and why)?

We have chosen Python that is a programming language that we both like. It is intuitive and really complete. There is also a great community behind it and this is really helpful when you need to find an answer on the internet.

- What kind of programming paradigm does this language belong to (functional, procedural, logic, object-oriented, multi-paradigm, ...)?
- Give a brief introduction to the core syntax / semantics / concepts of that language.
- Give an illustrative working code example of a typical program written in that language.

```
1 a, b = (1, 1)
2 while b < 10:
3     print 'a={0}, b={1} and a+b={2}'.format(a, b, (a+b))
4     a, b = (b, a + b)
```

We can run this program by executing the following command :

```
1 $ python example.py
```

And this is its output :

```
1 a=1, b=1 and a+b=2
2 a=1, b=2 and a+b=3
3 a=2, b=3 and a+b=5
4 a=3, b=5 and a+b=8
5 a=5, b=8 and a+b=13
```

- What kind of typical applications is the language targeted at?

This language can be used in various kind of application domains such as :¹

1. Web and Internet Development :

- Frameworks such as Django and Pyramid
- Micro-frameworks such as Flask and Bottle
- Advanced content management systems such as Plone

2. Scientific and Numeric :

- SciPy is a collection of packages for mathematics, science, and engineering
- Pandas is a data analysis and modeling library

3. Education : We learned programming with Java but Python seems to be more appropriate as it has a simpler syntax for a similar behaviour.

¹<https://www.python.org/about/apps/>

4. Software Development : Even big softwares are done in Python. For example the well known game *Sid Meier's Civilization IV* has been nearly completely implemented in Python.

2 Reflection and meta-programming

2.1 Reflective features

- What language features for dealing with reflection and meta-programming does the chosen language provide?
- What kinds of reflection and meta-programming features does that language offer?
- What is the MOP (meta-object protocol) for that language?
- What are the limitations of the reflective features provided by this language?
- Illustrate your explanations with working code fragments.

2.2 Applications of reflection

- What are the typical applications that reflection could be used for in this language?
- Can you give a working code example of such a typical problem that requires a reflective solution?
- Does there exist a “killer-app” for this language that has been implemented with reflection?

2.3 Comparison with other languages

- How does this language compare to Smalltalk, Java or Ruby from the point of view of the reflective features it supports, the kinds of reflection it offers, or its MOP?
- What can this language learn from those languages?
- Does it offer some specific reflective features that you do not have in either Smalltalk, Ruby or Java? (Can Smalltalk/Java learn something from reflection in this language?)
- Does it offer some powerful native (non-reflective) features that allow you to express things for which you would need reflection in other languages (like Smalltalk, Ruby or Java)?

and meta-programming

3 Conclusion

In conclusion, how good does this language score as a reflective language?

- o Does it provide a very rich, well-structured and well-supported set of reflective features that are supported by the programming environment as well?
- o Are there only a few ad-hoc reflective features that are not well supported by the environment?
- o What can other (reflective) languages learn from this language?
- o What can this language learn from how reflection is dealt with in other languages?
